WiFi tracker

Intention

The school is considering using WiFi data to keep track of how many and how often students are at school to help the student and improve the educational process.

Explanation

If students make contact with the WiFi network, this will be registered. The data is anonymized and used to improve the educational process and the use of the buildings. In addition, the student can also see the data, if desired. In an app (locally, because of privacy rules!) his schedule is compared with his 'time at school', the time his fellow students spend at school and even – if the student wants it – his screen time at school. In this way, the student has an additional means of reflecting on his study behavior at school.
