The AI factchecker

Intention

News received by the editorial office of a regional media institution is checked by AI software for authenticity and manipulation using generative AI. If the 'fakeness' - score is too high, the message is not published.

Explanation

More and more people are able to create fake messages using generative AI. They create fake videos, images or texts. Therefore, there is software that can be used to control that. This software is far from perfect, but editors would rather miss a "scoop" than throw additional fake news into the world.
